Benefits of WL45

- Significant root development without canopy development, due to only 1.8% N, but rich micronutrients.
- Roots develop even in winter at > 12°C.
- Very high micro-organism count to enhance nutrient uptake with high humic content & natural fungistatic action. Ideal for establishment and in nutrient depleted soils.
- Can be sprayed as a foliar control of fungal diseases.
- Reduces soil moisture stress.
- No sediment particle so easily sprayed or used in misters.
- No odour; pH 7.2; low N:P:K, <500mg/L tds

- To be used on*
- **Cereal**
Malt Barley, Rice, Wheat
 - **Legumes**
Lucerne, Medic Pastures
 - **Small Seeds**
Canola, Sunflower, Sorghum
 - **Turf Culture**
 - **Field Roses**
 - **Potatoes, Onions,**
 - **Carrots, Capsicum**

Applications

- Can be applied as a foliar spray or misted at sowing time, WL45 Organic liquid which should be diluted at 45 parts water to 1 part WL45 Organic liquid. WL45 Organic liquid is not a concentrated nutrient source but rather a fungistatic fungicide that prevents the incidence of grey mould (Botrytis) and root rot (Sclerotinia) often caused by poor air circulation. WL45 Organic liquid is rich in micro-organisms that accelerate nutrient breakdown, uptake and rapid root development, even when applied as a foliar spray. It is also rich in potassium for chlorophyll manufacture and increased protein on cereal, seed and turf crops. Optimum uptake above 12°C and below 35°C.
- When roots or stolons are active use WL45 Organic Liquid as a periodic foliar spray at any stage during the growth cycle but use it in conjunction with your crop specific nutrient additives, albeit at lower concentrations. No agitation is required as there is no sediment. WL45 Organic liquid can be used right up to harvest as there is no withholding period and no defoliation on woolly leaf crops.
- Ideal for sprayers, foggers and misters, diluted at the same rate of 45 parts water to 1 part WL45 Organic liquid, as there is no residue or nutrient lockup.
