

WL30 For controlled environment growing

100%
Organic

Sizes
available
25 litre
200 litre
1000 litre

To be used on

- Tomatoes
- Cucumbers
- Capsicum
- Carnations
- Lettuce
- Hydroponic crops
- Lilliums & Tulips

Applications

Benefits of WL30

- Significant root development without canopy development, due to only 1.8% N, but rich micronutrients.
 - Roots develop even in winter at > 12°C.
 - Very high micro-organism count to enhance nutrient uptake with high humic content & natural fungistatic action.
 - Ideal for establishment and in nutrient depleted media.
 - Can be sprayed as a foliar control of fungal diseases
 - WL30 Organic liquid is not light sensitive.
 - No sediment particle so easily sprayed or used in fertigators.
 - No odour; pH 7.2; low N:P:K, <500mg/L tds
- When planting seedlings foliar spray WL30 Organic liquid which should be diluted at the rate of 30 parts water to 1 part WL30 Organic liquid, spray weekly to run-off. WL30 Organic liquid is not a concentrated nutrient source, but rather a fungistatic fungicide that prevents the incidence of grey mould (Botrytis) and root rot (Sclerotinia) often caused by poor air circulation. WL30 Organic liquid is rich in micro-organisms that accelerate nutrient breakdown, uptake and rapid root development, even when applied as a foliar spray. It is also rich in potassium for flower health and chlorophyll manufacture; essential under lights. Optimum uptake above 20 degrees C and below 30 degrees C. Within a relative humidity of 50—65 degrees.
 - When fruit sets you can continue to use WL30 Organic Liquid as a weekly foliar spray at any stage during the growth cycle used in conjunction with your crop specific nutrient additives; no agitation is required as there is no sediment. The liquid can be used right up to harvest as there is no withholding period and no defoliation, even on woolly leaf plants.
 - Also ideal for sprayers, in-line fertigators or drippers diluted at the same rate of 30 parts water to 1 part WL30 Organic liquid, as there is no residue or nutrient lockup.
